### 3.2 BACK-LIGHT UNIT

The back-light system is an edge-lighting type with 4 CCFTs(Cold Cathode Fluorescent Tube).

The characteristics of four lamps are shown in the following tables.

$T_a = 25 \pm 2 \text{ } ^\circ\text{C}$

ITEM	SYMBOL	MIN	TYP	MAX	UNIT	NOTE
Lamp Current	IL	3.0	6.0	6.5	mArms	(1)
Lamp Voltage	VL	-	665	-	Vrms	IL=6.0 mArms
Lamp Frequency	FL	40	-	60	kHz	(2)
Operating Life Time of Lamp	Hr	25,000	35,000	-	Hour	(3)
Startup Voltage	Vs	-	-	1020 (25°C)	Vrms	(4)
				1430 (0°C)		

**Note) The waveform of the inverter output voltage must be area symmetric and the design of the inverter must have specifications for the modularized lamp.**

The performance of the back-light, for example life time or brightness, is much influenced by the characteristics of the DC-AC inverter for the lamp. So all the parameters of an inverter should be carefully designed so as not to produce too much leakage current from high-voltage output of the inverter. When you design or order the inverter, please make sure that a poor lighting caused by the mismatch of the back-light and the inverter(miss lighting, flicker, etc.) never occur. When you confirm it, the module should be operated in the same condition as it is installed in your instrument.

Note (1) Lamp current is measured with current meter for high frequency as shown below.

- (2) Lamp frequency may produce interference with horizontal synchronous frequency and this may cause line flow on the display. Therefore lamp frequency shall be detached from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.
- (3) Life time (Hr) of a lamp is defined as the time in which it continues to operate under the condition of  $T_a = 25 \pm 2 \text{ } ^\circ\text{C}$  and  $I_L = 6.0 \text{ mArms}$  until the brightness becomes 50% or lower than its original value.
- (4) The voltage above this value should be applied to the lamps for more than 1 second to startup. Otherwise the lamps may not to be turned on.

## 6.4 Power ON/OFF Sequence

: To prevent a latch-up or DC operation of the LCD module, the power on/off sequence should be as the diagram below.

## NOTE.

- (1) The supply voltage of the external system for the module input should be the same as the definition of V<sub>DD</sub>.
- (2) Apply the lamp voltage within the LCD operation range. When the back-light turns on before the LCD operation or the LCD turns off before the back-light turns off, the display may momentarily become white.
- (3) In case of V<sub>DD</sub> = off level, please keep the level of input signals on the low or keep a high impedance.
- (4) T<sub>4</sub> should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.

### 11.1 Handling

- (a) When the module is assembled, It should be attached to the system firmly using every mounting holes. Be careful not to twist and bend the modules.
- (b) Refrain from strong mechanical shock and / or any force to the module. In addition to damage, this may cause improper operation or damage to the module and CCFT back-light.
- (c) Note that polarizers are very fragile and could be easily damaged. Do not press or scratch the surface harder than a HB pencil lead.
- (d) Wipe off water droplets or oil immediately. If you leave the droplets for a long time, Staining and discoloration may occur.
- (e) If the surface of the polarizer is dirty, clean it using some absorbent cotton or soft cloth.
- (f) The desirable cleaners are water, IPA(Isopropyl Alcohol) or Hexane. Do not use Ketone type materials(ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanent damage to the polarizer due to chemical reaction.
- (g) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, legs or clothes, it must be washed away thoroughly with soap.
- (h) Protect the module from static, it may cause damage to the C-MOS Gate Array IC.
- (i) Use finger-stalls with soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (j) Do not disassemble the module.
- (k) Do not pull or fold the lamp wire.
- (l) Do not adjust the variable resistor which is located on the back side.
- (m) Pins of I/F connector shall not be touched directly with bare hands.

## 11.2 Storage

- (a) Do not leave the module in high temperature, and high humidity for a long time.  
It is highly recommended to store the module with temperature from 0 to 35 °C and relative humidity of less than 70%.
- (b) Do not store the TFT-LCD module in direct sunlight.
- (c) The module shall be stored in a dark place. It is prohibited to apply sunlight or fluorescent light during the store.

## 11.3. Operation

- (a) Do not connect, disconnect the module in the “ Power On” condition.
- (b) Power supply should always be turned on/off by following item 6.6 “ Power on/off sequence “.
- (c) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimize the interference.
- (d) The cable between the back-light connector and its inverter power supply shall be a minimized length and be connected directly . The longer cable between the back-light and the inverter may cause lower luminance of lamp(CCFT) and may require higher startup voltage(Vs).

## 11.4 Others

- (a) Ultra-violet ray filter is necessary for outdoor operation.
- (b) Avoid condensation of water. It may result in improper operation or disconnection of electrode.
- (c) Do not exceed the absolute maximum rating value. ( the supply voltage variation, input voltage variation, variation in part contents and environmental temperature, so on)  
Otherwise the module may be damaged.
- (d) If the module displays the same pattern continuously for a long period of time, it can be the situation when the image “sticks” to the screen.
- (e) This module has its circuitry PCB's on the rear side and should be handled carefully in order not to be stressed.

## 1.2 Outgoing Inspection Criteria

### 1.2.1 Inspection Introduction

#### 1.2.1.1 Conditions

<i>viewing distance</i>	30 ~ 50 cm
<i>ambient illumination</i>	300 ~ 700 Lux (nominal 500 Lux)
<i>ambient temperature</i>	25 + - 3 'C
<i>viewing angle</i>	The surface of the module and the inspector's line of view shall be at 90 degrees.
<i>display pattern</i>	XGA - R, G, B, Black, White
<i>inspection area</i>	active area

#### 1.2.1.2 Defect Modes

##### *dark / bright spots*

points on the display which appear dark / bright and remain unchanged in size

##### *dark / bright lines*

lines on the display which appear dark / bright and remain unchanged in size

##### *polarizer scratch*

when the unit is lit a light, line is seen across a darker background; line does not vary in size

##### *polarizer dent*

when the unit is lit a light, light(white) spots appear against a darker background, and do not vary in size

##### *bright/dark dot*

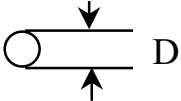

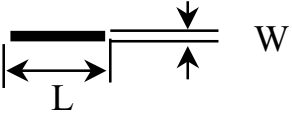

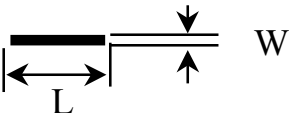

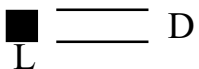

a sub-pixel (R, G, B dot) stuck off / on

## 1.2.2 Mechanical Inspection

<i>Chassis Gap</i>	max. 0.7mm
<i>Silicone Gasket (Glue)</i>	silicone material shall not be exposed beyond the metal frame edge into the view area
<i>Light Leakage</i>	there shall be no visible light around the edges of the screen.

- \* *If there is none identified criteria in this specification, Samsung will refer production specification that Customer and Samsung agreed.*
- \* *If there is mechanical dimension issue which has no designated tolerance, Samsung will apply natural tolerance.*
