1. General Description

LM270WQHD is a Color Active Matrix Liquid Crystal Display with Light Emitting Diode (White LED) backlight system without LED driver. The matrix employs a-Si Thin Film Transistor as the active element. It is a transmissive type display operating in the normally black mode. It has a 27inch diagonally measured active display area with QHD resolution (2560 horizontal by 1440 vertical pixel array) Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 8-bit gray scale signal for each dot, thus, presenting a palette of more than 16,7M(True) colors.

It has been designed to apply the 8Bit 4Lane Display port interface.

It is intended to support displays where high brightness, super wide viewing angle, high color saturation, and high color are important.

General Features

Active Screen Size	27.0 inches(68.47cm) diagonal
Outline Dimension	630.0(H) x 376.13(V) x 21.8(D) mm(Typ.)
Pixel Pitch	0.2331 mm x 0.2331 mm
Pixel Format	2560 horiz. By 1440 vert. Pixels RGB stripes arrangement
Color Depth	8-bit, 16,777,216 colors
Luminance, White	380 cd/m ² (5 points Avg.)
Viewing Angle(CR>10)	View Angle Free (R/L 178(Typ.), U/D 178(Typ.))
Power Consumption	Total 96.91 Watt (Max.) (15.36 Watt @VLCD, Max 81.55 Watt_Duty 100% of DC 350 mA_w/o driver)
Weight	4600 g (typ.)
Display Operating Mode	Transmissive mode, normally black
Surface Treatment	Glare (Low Reflection treatment of the front polarizer)
HDCP	HDCP key implemented in Tcon (DP628)

3. Electrical Specifications

3-1. Electrical Characteristics

It requires two power inputs. One is employed to power the LCD electronics and to drive the TFT array and liquid crystal. The second input power for the DP Rx.

LED driver design guide

: The design of the LED driver must have specifications for the LED in LCD Assembly.

The performance of the LED in LCM, for example life time or brightness, is extremely influenced by the characteristics of the LED driver.

So all the parameters of an LED driver should be carefully designed and output current should be Constant current control.

When you design or order the LED driver, please make sure unwanted lighting caused by the mismatch of the LED and the LED driver (no lighting, flicker, etc) never occurs.

When you confirm it, the LCD module should be operated in the same condition as installed in your instrument.

- 1. Specified values are for a single LED bar including Left & Right Bar.
- 2. The specified current is input LED chip 100% duty current.
- 3. The specified voltage is input LED string and Bar voltage at typical 350 mA 100% duty current.
- 4. The specified power consumption is input LED string & bar power consumption at typical 350 mA 100% duty current.
- 5. The life is determined as the time at which luminance of the LED is 50% compared to that of initial value at the typical LED current on condition of continuous operating at $25 \pm 2^{\circ}$ C.
- 6. The LED bar power consumption shown above does not include loss of external driver.
 - The used LED bar current is the LED typical current.
 - String Power Consumption is calculated with $PS = VS \times IS$
 - Bar Power Consumption is calculated with PL = VBarx Is
- 7. LED operating DC Forward Current and Junction Temperature must not exceed LED Max Ratings.

3-3. Signal Timing Specifications

All of the interface signal timing should be satisfied with the following specifications for it's proper operation.

Table 6. TIMING TABLE (VESA COORDINATED VIDEO TIMING)

	ITEM	SYMBOL	Min	Тур	Max	Unit	Note
D 61.14	Period	tCLK	4.14	4.14	4.14	ns

Note: Hsync period and Hsync width-active should be even number times of tclk. If the value is odd number times of tclk, display control signal can be asynchronous. In order to operate this LCM a Hsync, Vsync, and DE(data enable) signals should be used.

- 1. The performance of the electro-optical characteristics may be influenced by variance of the vertical refresh rates.
- 2. Vsync and Hsync should be keep the above specification.
- 3. Hsync Period, Hsync Width, and Horizontal Back Porch should be any times of character number(8).
- 4. The polarity of Hsync, Vsync is not restricted.

3-5. Color Data Reference

The Brightness of each primary color(red,green,blue) is based on the 8-bit gray scale data input for the color; the higher the binary input, the brighter the color. The table below provides a reference for color versus data input.

3-6-1. Power Sequence

Notes: 1. Please avoid floating state of interface signal at invalid period.

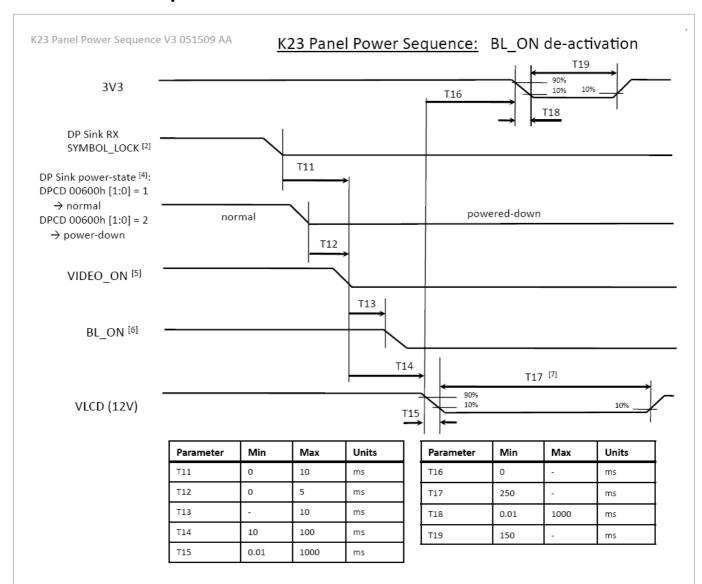

- 2. When the interface signal is invalid, be sure to pull down the power supply for LCD $V_{\rm LCD}$ to 0V.
- 3. LED power must be turn on after power supply for LCD and interface signal are valid.

- [4] Power-state set by Source in Sink DPCD register 00600h
- [5] VIDEO_ON asserted low by Sink because of:
 - 1) loss of SYMBOL_LOCK or
 - 2) DP Sink is powered down
- [6] BL_ON must be asserted low by system as rapidly as possible when video is invalid to avoid visible artifacts
- [7] T17 always > T19
- [8] min. times of 0 indicate precedence ordering of events, e.g. where actual timing is TBD

*** This timing is for fabrication purpose only, not for normal operation. ***

^{*} EDID Read time and EDID write time will be exclusive.

Notes.

In case of without DP signal after DP logic power on, check HPD after TE1 time and if HPD is low status then any time can read EDID

4. Optical Specifications

Optical characteristics are determined after the unit has been 'ON' for approximately 120 minutes in a dark environment at 25 ± 2 °C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of Φ and θ equal to 0 ° and aperture 1 degree.

FIG. 1 presents additional information concerning the measurement equipment and method.

Notes 1. Contrast Ratio(CR) is defined mathematically as:

$$Contrast Ratio = \frac{Surface Luminance with all white pixels}{Surface Luminance with all black pixels}$$

It is measured at center point(Location P1)

- 2. Surface luminance(LwH)is luminance value at 5 points average across the LCD surface 50cm from the surface with all pixels displaying white. For more information see FIG 2.

 LwH = = Average[Lon1,Lon2,Lon3,Lon4,Lon5]
- 3. The variation in surface luminance , δ WHITE is defined as :

$$\delta_{\textit{WHITE}} = \frac{\text{Maximum}(L_{\textit{on1}}, L_{\textit{on2}}, \dots, L_{\textit{on13}}) - \text{Minimum}(L_{\textit{on1}}, L_{\textit{on2}}, \dots, L_{\textit{on13}})}{\text{Average}(L_{\textit{on1}}, L_{\textit{on2}}, \dots, L_{\textit{on5}})} \times 100(\%)$$

Where L1 to L13 are the luminance with all pixels displaying white at 13 locations. For more information see FIG 2.

- 4. Response time is the time required for the display to transition from black to white (Rise Time, Tr_R) and from white to black (Decay Time, Tr_D). For additional information see FIG 3
- 5. Color shift is the angle at which the color difference is lower than 0.04. For more information see FIG 4.
 - Color difference (∆u'v')

$$u' = \frac{4x}{-2x+12y+3}$$
 $v' = \frac{9y}{-2x+12y+3}$

- Pattern size: 25% Box size
- Viewing angle direction of color shift: Horizontal, Vertical
- 6. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG 5.
- 7. Effective viewing angle is the angle at which the gamma shift of gray scale is lower than 0.3. For more information see FIG 6 and FIG 7.
- 8. Gray scale specification Gamma Value is approximately 2.2. For more information see Table 10.

9. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD module.

9-1. MOUNTING PRECAUTIONS

- (1) You must mount a module using holes arranged in four corners or four sides.
- (2) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
- (3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to the resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment.
 Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front / rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.

9-2. OPERATING PRECAUTIONS

- (1) The spike noise causes the miss-operation of circuits. It should be lower than following voltage : $V=\pm 200 mV$ (Over and under shoot voltage)
- (2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
- (3) Brightness depends on the temperature. (In higher temperature, it becomes lower.)

 And in lower temperature, response time(required time that brightness is stable after turned on) becomes longer.
- (4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimized the interference.
- (7) Please do not give any mechanical and/or acoustical impact to LCM. Otherwise, LCM can't be operated its full characteristics perfectly.
- (8) A screw which is fastened up the steels should be a machine screw. (if not, it causes metallic foreign material and deal LCM a fatal blow)
- (9) Please do not set LCD on its edge.

Ver. 1.0 SEP. 16. 2009 32 / 37

9-3. ELECTROSTATIC DISCHARGE CONTROL

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc. And don't touch interface pin directly.

9-4. PRECAUTIONS FOR STRONG LIGHT EXPOSURE

Strong light exposure causes degradation of polarizer and color filter.

9-5. STORAGE

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
- (2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.

9-6. HANDLING PRECAUTIONS FOR PROTECTION FILM

- (1) The protection film is attached to the bezel with a small masking tape.

 When the protection film is peeled off, static electricity is generated between the film and polarizer.

 This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
- (2) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the bezel after the protection film is peeled off.
- (3) You can remove the glue easily. When the glue remains on the bezel surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.
